Introduction I

- ▶ The Network-on-Chip (NoC) has been widely adopted as a paradigm capable of providing a reliable and scalable interconnection in MPSoCs [?], [?]
- ▶ The concern for data protection appears as a design requirement of MPSoCs
- ▶ Protection usually occurs at either:
 - ▶ *Application Level*, e.g., using data encryption or source authentication; or
 - ▶ *Communication Level*, e.g., detecting abnormal communication behavior in the system.

Introduction II

- ▶ NoCs have been shown to aid in the overall MPSoC protection [?], [?], [?], by implementing security services at communication level

Evaluation Criteria

Preliminary Results

Work Schedule

Objectives

- ▶ The definition of a routing model that is capable of considering system security requirements to define safe routing paths
- ▶ The creation of an abstract model that enables the implementation and the verification of the routing technique
- ▶ The validation and evaluation of the routing algorithm for different security configurations
- ▶ The adaptation of an existing NoC simulation platform to employ this new routing model for behavior evaluation

Work Schedule

Research

- ▶ This work is based on two premises:
 - (i) that sensitive applications communicate over the NoC in MPSoCs, and are therefore vulnerable to interference by malicious applications; and
 - (ii) that protection from software attacks is achieved by communication level protection; e.g., by defining safe communication paths for sensitive applications
- ▶ Therefore, a routing algorithm that is capable of defining safe routing paths for sensitive applications should enhance the overall system protection

Work Schedule

Threat Model

- ▶ The NoC is considered secure, meaning that an attacker cannot tamper its resources
- ▶ An attacker, aware of the sensitive path, can disrupt communication between a source and a destination
- ▶ We consider that an attacker can either generate a *DoS* or

Work Schedule

Security Zones

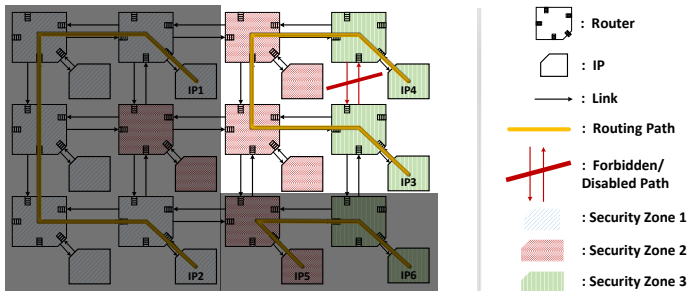

- ▶ A security zone is a physical space (continuous or disrupted) that wraps IPs that execute critical applications
- ▶ The task mapping of critical applications defines the shape of the security zone
- ▶ Certain IP blocks might not be assigned to any security zone, e.g., idle resources or shared memories

Communication in Security Zones

- **Full intra-zone communication (FIZ):** S and D are in the same SZ . The sensitive path is **completely** inside the SZ , e.g., the path from $IP1$ to $IP2$

Communication in Security Zones

- *Partial intra-zone communication (PIZ)*: S and D are in the same SZ . However, the sensitive path is **partially** inside the SZ . , e.g., the path from $IP3$ to $IP4$

Communication in Security Zones

- **Inter-zone communication (IZ):** S and D are in different SZ, e.g., the path from $IP5$ to $IP6$

Segment-based Routing (SBR) - Deadlock Prevention

○ : Router □ : Segment
 — : Link — : Disabled Link / : Turn Restriction

Starting Segment:

Regular Segment:

Unitary Segment:

- Logically partitions the NoC into segments

Segment-based Routing (SBR) - Deadlock Prevention

○ : Router □ : Segment
 — : Link — : Disabled Link / : Turn Restriction

Starting Segment:

Regular Segment:

Unitary Segment:

- Each segment contains a localized bidirectional turn restriction

Segment-based Routing (SBR) - Deadlock Prevention

○ : Router □ : Segment
 — : Link — : Disabled Link ↘ : Turn Restriction

Starting Segment:

Regular Segment:

Unitary Segment:

- Guarantees global deadlock freedom and reachability (as long as the NoC is connected)

SBR-Security Zone Awareness (SBR-SZA)

- Traditional SBR might place turn restrictions that causes *PIZ* routing

SBR-Security Zone Awareness (SBR-SZA)

— : Disabled Link (*Unitary*)

○ : Router

— : Segment

● : Security Zone 1

— : Link

⌋ : Turn Restriction

● : Security Zone 2

- SBR-SZA aims to create segments that tailor to security zone shapes

Region-based Routing (RBR) - Routing Algorithm

- ▶ Populates the routing tables of NoC routers, considering the turn restrictions of SBR
- ▶ Groups routing entries to greatly reduce table size (interval routing and port/destination sets)
- ▶ There are three steps in RBR computation:
 - ▶ *Routing Computation*: computes all source and destination pairs
 - ▶ *Region Computation*: joins entries based on input and output ports
 - ▶ *Region Merge*: merges overlapping regions to reduce routing entries

Evaluation Criteria

Preliminary Results

Work Schedule

Modeling

- : Router # : Cost Relative to S SZ ● : Security Zone 1
 — : Link ∩ : Turn Restriction ● : Security Zone 2
 — : Path of Least Cost is {S,R1,R2,D}

- ▶ The NoC is modeled as a graph, with IP/Routers as vertices and links as edges

Modeling

- : Router # : Cost Relative to S SZ ● : Security Zone 1
 — : Link / : Turn Restriction ● : Security Zone 2
 — : Path of Least Cost is {S,R1,R2,D}

- Each vertex belongs to a security zone, and each edge has a positive weight that is set according to the path-finding iteration

Modeling

○ : Router

: Cost Relative to S SZ

● : Security Zone 1

— : Link

⌋ : Turn Restriction

● : Security Zone 2

— : Path of Least Cost is {S,R1,R2,D}

- Edge weight can represent the cost to employ encryption to a sensitive packet

NoC Configuration Tool

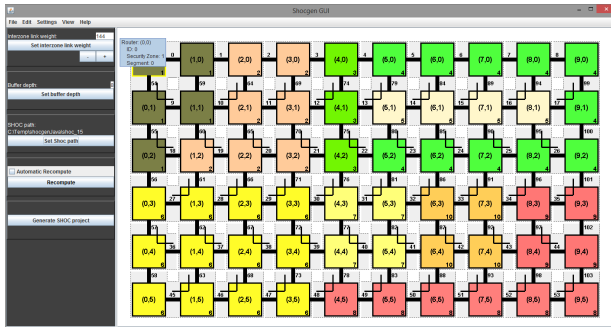

- Graphical configuration tool to generate and compute scenarios at *design time*

NoC Configuration Tool

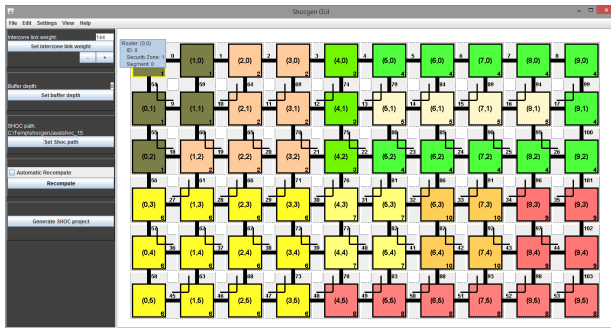

- Implements SBR and RBR algorithms to populate routing entries

NoC Configuration Tool

- Performs routing entries, *FIZ/PIZ* routing paths, and latency evaluations

NoC Configuration Tool

- Outputs the generated configuration to a SystemC simulation platform

Evaluation Criteria

Scenario	NoC Dimension (Columns X Rows)	SBR Seeds	Segmentation Modes	Configurations per Scenario
NASA NAS	13x13	169	<i>SBR / SBR-SZA</i>	338
Synth 1	6x4	24	<i>SBR / SBR-SZA</i>	48
Synth 2	10x6	60	<i>SBR / SBR-SZA</i>	120
Total:				506

- ▶ Three scenarios evaluated: 2 synthetic and 1 based on a real application communication dependency trace
- ▶ Evaluation consists of four preliminary steps
 - ▶ Seed for segment computation
 - ▶ SBR computation
 - ▶ RBR computation
 - ▶ Evaluation of obtained configuration

Evaluation Criteria

Scenario	NoC Dimension (Columns X Rows)	SBR Seeds	Segmentation Modes	Configurations per Scenario
NASA NAS	13x13	169	<i>SBR</i> / <i>SBR-SZA</i>	338
Synth 1	6x4	24	<i>SBR</i> / <i>SBR-SZA</i>	48
Synth 2	10x6	60	<i>SBR</i> / <i>SBR-SZA</i>	120
Total:				506

- ▶ Three evaluations were performed:
 - ▶ Routing table scalability
 - ▶ **FIZ/PIZ** occurrences
 - ▶ Latency estimation
